

Standard Specification for Topsoil Used for Landscaping Purposes¹

This standard is issued under the fixed designation D 5268; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers a physical evaluation of an inorganic soil containing a limited amount of organic material, relative to its use as a topsoil for horticultural purposes in construction. For classification, a full agricultural textural classification may be used.

1.2 The presence in the soil of the correct nutrients and pH status is necessary for healthy plant growth. This specification does not, however, cover a determination of the nutrients, nor their availability.²

NOTE 1—The nutrient content of topsoil is important and the chemicals usually evaluated are nitrogen, phosphate, and potassium. Nutrient deficiencies may be corrected using fertilizers. Excess soluble salts should be examined as to their desirability. The acidity or alkalinity of the soil is also important. Excess acidity may be corrected by the application of lime dust. Excess alkalinity may be corrected by the application of sulfur or other suitable acidifying compounds. The latter item, in addition to lowering pH, also could be considered as an aggregate when considering the particle size distribution.

1.3 The values stated in SI units are to be regarded as the standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

E 11 Specification for Wire-Cloth Sieves for Testing Purposes⁴

3. Terminology

3.1 Definitions:

3.1.1 For definitions of other terms used in this specification, refer to Terminology D 653.

3.2 Description of Term Specific to This Standard:

3.2.1 *topsoil*—usually the original surface layer of grassland or cultivated land. It does not generally include soil from peatlands or other special areas, such as land disturbed by industrial activity. Topsoil is usually a darker shade of brown, grey, or red than the subsoil that lies immediately beneath it, because it contains organic matter intimately mixed with the mineral matter. Topsoil tends to be more friable and pervious than inorganic soils.

4. Significance and Use

4.1 When physically evaluating a soil, relative to its suitability to support plant growth (primarily grasses), tests must be made to determine the presence and the amount of organic matter, inorganic matter (sand, silt and clay), and deleterious materials.

4.2 Typical general ranges of soil content are presented in Table 1. Soils falling within these ranges will generally form a suitable topsoil. It must, however, be recognized that in some geographic regions, concurrence with the values of Table 1 would be most difficult. In such cases, locally acceptable specifications would need to be developed.

5. Apparatus

5.1 *Sieves and Containers*, in accordance with Test Method D 1140.

5.2 *Muffle Furnace*, capable of producing the required ashing temperature in accordance with Test Methods D 2974.

6. Procedure

6.1 Select a representative sample of the topsoil as indicated in Test Method D 1140.

6.2 Oven-dry the sample at $105 \pm 5^\circ\text{C}$ and determine its mass.

6.3 Screen the sample over a No. 4 (4.75 mm) sieve and identify this deleterious material fraction as rock, gravel, slag, cinder, roots, sod, and the like.

⁴ *Annual Book of ASTM Standards*, Vol 14.02.

TABLE 1 Specification for Topsoil

Compositional Category	Percentage by Mass
Total Sample:	
Deleterious materials (rock, gravel, slag, cinder, roots, sod)	5 max
Material passing the No. 4 (4.75 mm) sieve:	
Organic material	2 to 20
Sand content	20 to 60
Silt and clay content	35 to 70
pH	5 to 7

6.4 Take a specimen of the fraction passing the No. 4 (4.75 mm) sieve and determine the percentage by mass of organic matter fractions by ashing at 440°C using the techniques described in Test Methods D 2974.

6.5 Take another specimen and test in accordance with Test Method D 1140 to find the percentage of the minus No. 4 (4.75

mm) sieve fraction that is retained on the No. 200 (75 µm) sieve. Take care to agitate the samples so that all organic matter be decanted away. This represents the sand content. Calculate the silt/clay content of the minus No. 4 (4.75 mm) sieve material as the difference between 100 and the sum of the sand and organic matter percentages.

7. Report

7.1 Report the percentages by mass of the following:

- 7.1.1 Deleterious materials.
- 7.1.2 Organic material.
- 7.1.3 Sand content, and
- 7.1.4 Silt and clay content.

8. Keywords

8.1 landscaping; organic material; plant growth; soil; topsoil

The American Society for Testing and Materials takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, 100 Barr Harbor Drive, West Conshohocken, PA 19428.
